

Dev machine configuration and application generation process

Section 1. One-time Software install, GitHub setup and configuration local machine:

1. ** Prerequisite: Install software**

Git - <https://git-scm.com/install/windows>

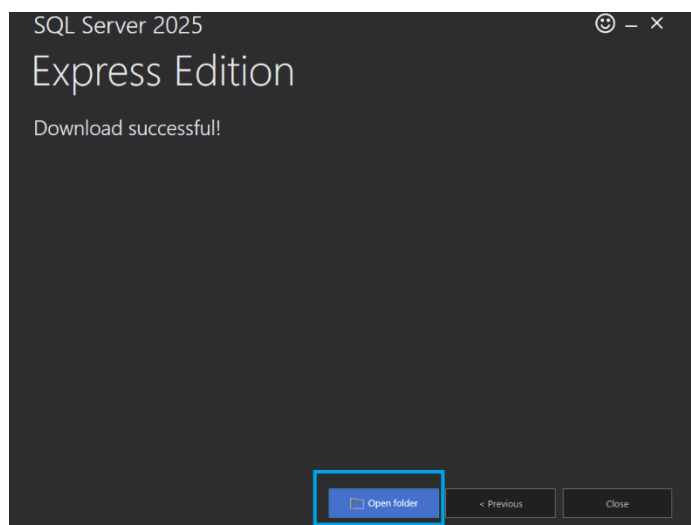

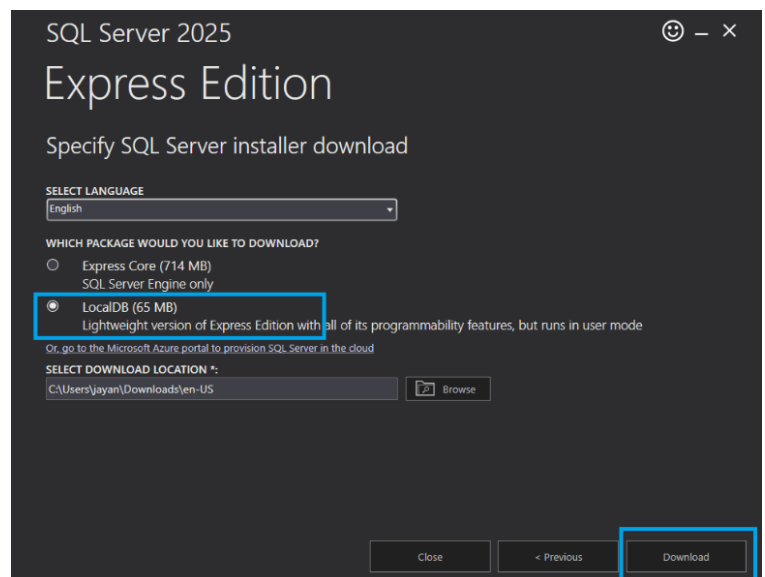

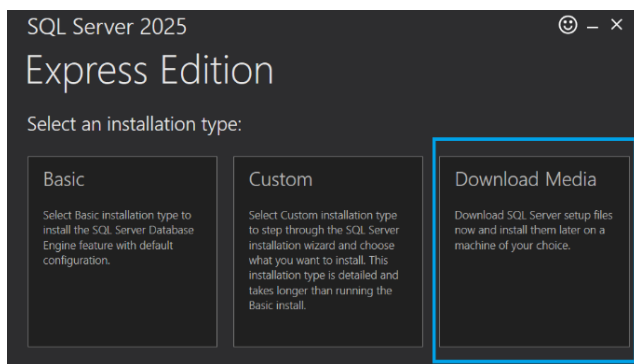

Node.js - <https://nodejs.org/en>

.NET 10 SDK – Download and run this exe: <https://dotnet.microsoft.com/en-us/download/dotnet/thank-you/sdk-10.0.300-windows-x64-installer>

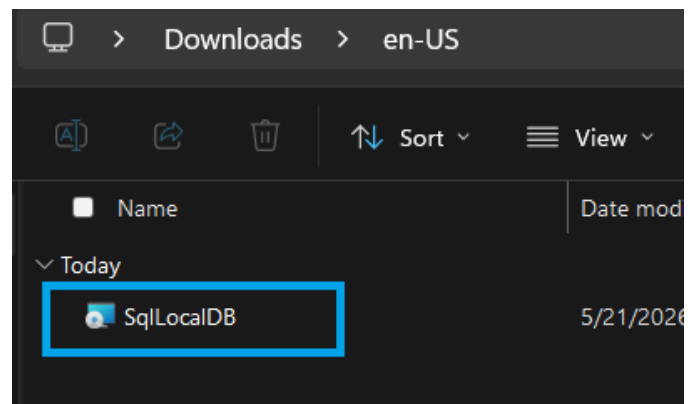

SQL Server 2025 Express Local DB – Download and run this exe:

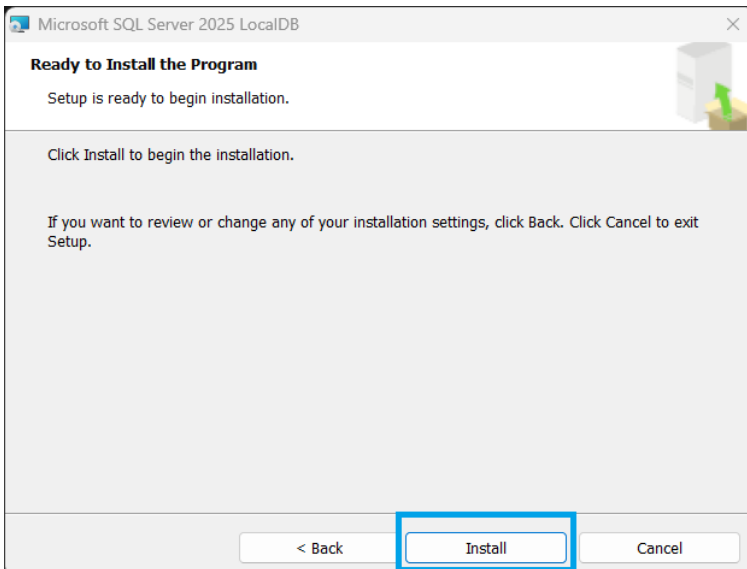

<https://go.microsoft.com/fwlink/p/?linkid=2216019&clid=0x409&culture=en-us&country=us>

SQL Server 2025 Express LocalDB Installation instructions:

Double click and start the installation

2. ** Create a GitHub personal account **

Until we are on MWS Enterprise environment, please use your personal GitHub account.

If you don't already have a GitHub account, create a new account from <https://github.com>

** After the account is created – please **email Alan Eicker** and provide him the email address associated with your GitHub account. He will grant you appropriate access so you can install solutions template in section 2.

3. **Create a personal access token in GitHub.**

- a) Login to <https://github.com/> with your personal account.
- b) Navigate to <https://github.com/settings/tokens>
- c) Click on "Generate new token" and select "Generate new token (classic)"
- d) For New **personal access token (classic)**
 - a. Add Note (Claude development)
 - b. Set Expiration to 90 days
 - c. Under select scopes – check "Repo" and "Read:Packages".
- e) Click on 'Generate token' button at the bottom.
- f) On the next screen make sure to copy your personal access token, as you won't be able to see it again. **Copy the token value** — save this in an editor temporarily, you'll need it in next steps.

4. **Create a `.npmrc` file** from terminal or PowerShell:

Search for "Windows Powershell" in Windows start menu and launch it.

Copy following command and hit enter in PowerShell. Replace [user_name] with your username on the machine. Check C:\Users folder to identify the username.

```
cd C:\Users\[user_name]
```

```
New-Item .npmrc
```

5. **Copy the following into your `.npmrc` file**

In File explorer, navigate to C:\Users\[user_name] folder. Open .npmrc file in an editor and copy-paste following 2 lines. Replace [YOUR_GITHUB_TOKEN] with the actual token value from step 2.

```
@alan-eicker:registry=https://npm.pkg.github.com
//npm.pkg.github.com/:_authToken=[YOUR_GITHUB_TOKEN]
```

6. Run following commands in PowerShell one at a time to configure your GitHub account:

```
git config --global user.name "[your GitHub personal account name]"
git config --global user.email "[your email address associated with GitHub personal account]"
```

Section 2. One-time config for every new application

1. **Install the latest solutions template ** (run this before every new project so you get latest template):

Launch Windows Powershell, copy-paste and run one command at a time:

```
npm cache clean --force
npm install -g @alan-eicker/northstar-cli
```

**** If you get an execution policy error, run this command in PowerShell:**

```
Set-ExecutionPolicy -ExecutionPolicy RemoteSigned -Scope CurrentUser
```

2. **Create your APP folder**

If claude_apps folder doesn't exist in C:\Users\[user_name], then **create a folder named claude_apps** in that location. Replace [user_name] below with your username on the machine. Check C:\Users folder to identify this. Launch Windows Powershell and navigate to claude_apps folder.

```
cd C:\Users\[user_name]\claude_apps
```

Need to run following command in Windows Powershell. Replace [app_name] with the name of the application you are building.

```
nstar create [app_name]
```

You will get prompted a few options. For - Creating GitHub remote repository. Which type of GitHub account?

1) Personal (github.com) or 2) Enterprise (SAML SSO).

Enter choice as 1

Next step will require you to enter the GitHub access token that you created in section 1, step 3. Use that token in next step. **Copy-paste your token in the prompt.**

****Token will not show up in the prompt for Security reasons and it will look empty. Just paste and hit enter.**

If you see "token rejected by GitHub error", run following command and then retry create app command:

```
git config --global --unset credential.helper
```

After this step, a folder with [app_name] should have been created in 'C:\Users\[user_name]\claude_apps' location. Check and confirm manually using file explorer.
